Architecture is a discrete system of powers. It could be nature, society, space and body. For architects, like us, what we are doing is seeking for implicit relationships between system and goal with our perception, then bringing them into space we create - this is how we inhabit the world.

In 4-years attempt, I experienced a transition from single rationality to a complex mixture of digital intelligent and humanity approaches. I believe that, in the foreseeable future, our mind will be the core of design and construction before the machine is truly intuitive.

SYSTEMAGIC

"The whole is greater than the sum of its parts"

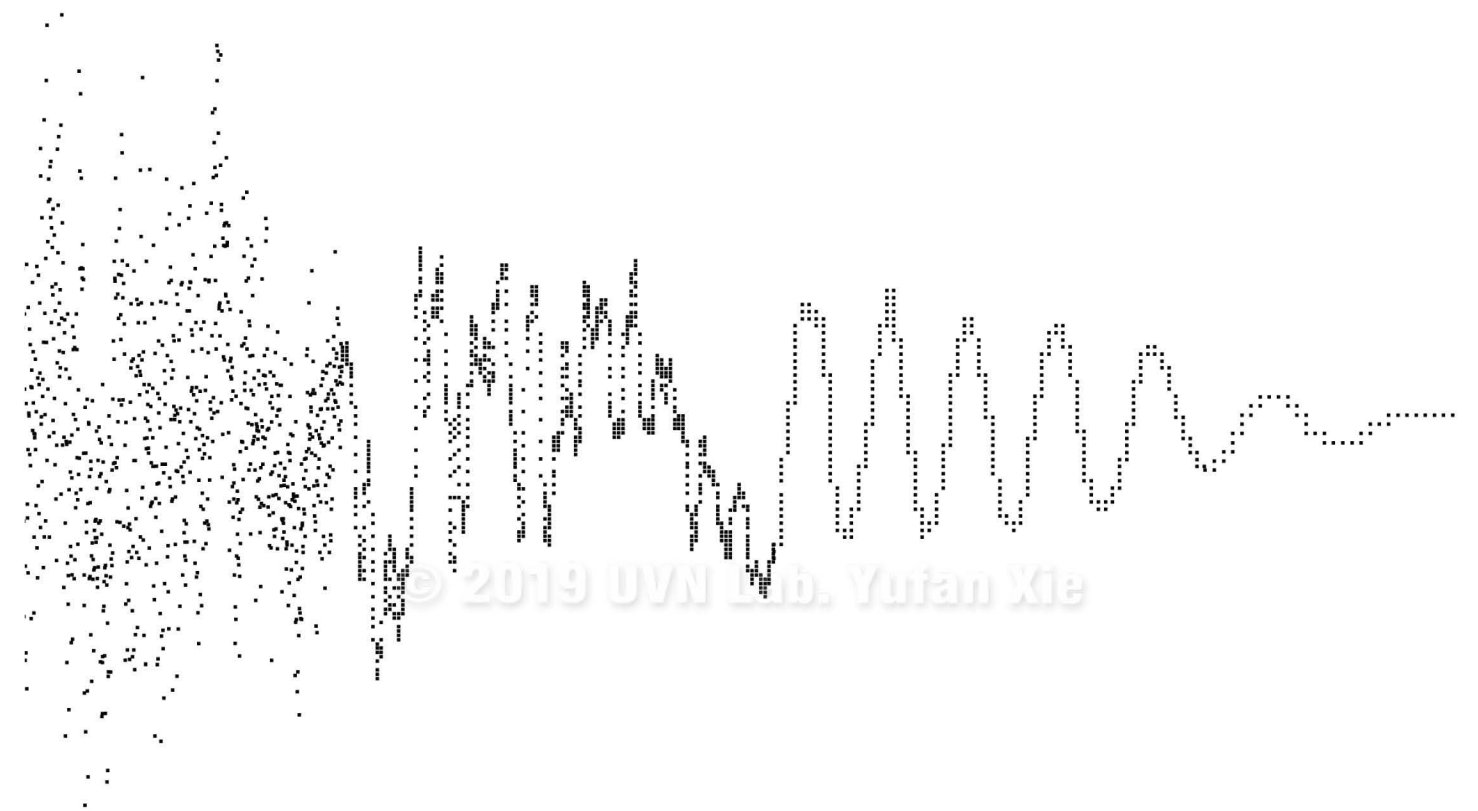

----- Aristotle

© 2019 UVN Lab. Yufan Xie

System is an organization of components, from which intelligence evolves. It's a comprehensive model of biology, space and society. By extracting basic rules from prototype and reconstruct, we create systems, from which intelligence evolves - namely systemagic.

Self-Organizing

System of Basic Behaviors

Self initiated project, 2017
Published on "CubicRAB"

© 2019 UVN Lab. Yufan Xie

© 2019 UVN Lab. Yufan Xie

**How we define behaviors,
how the system develops.**

As a cell, or a system of similar particles, it behaves like fluid, which can be counted as cloud in aerography. There is no "part" or "one", it's a whole system, an aggregation of behaviors.

Self-organizing is a generative project I launched since 2017 September. The origin purpose of this project was to imitate a Cellular-Automaton style algorithm. But my intent of "creating" system, or, designing a system made me rethink about how system works. Then, this idea pushed me forward, finally by picking basic behaviors from different prototypes and reconstructing them, I finished this algorithm as a mixed system - which can be seen as variation from any of its prototypes.

Link:
<https://vimeo.com/282106863>

THE SYSTEM

Particle Types

Seed

Growing and attracting points with lowest density located on "outer" edge.

Body

Dying and repelling points with highest density located "inside".

Prototypes

DLA-like

It's a density system, developing itself to fully occupy the space.

The whole system is based on 2 types of particles playing special roles: Seed and Body.

As system develops, points are changing between 2 types according to density.

Accordingly 2 pairs of basic behaviors are implemented - Birth and Death behaviors originated from DLA-like system, Attract and Repell behaviors (dynamic factors) originated from Differential system.

Separately, Seeds take Birth and Attract behaviors, Body take Death and Repell behaviors. Due to these functions they have, once calculation happens, the total quantity and distribution - the density will change, giving new principle to filter out new Body and Seed.

Rigid Body Aggregation

Differential

Dynamic Body

Birth

Density-detecting method based on Voronoi. Seed with lowest density will randomly generate a new point within birth-radius (B-R).

Death

When two particles get too close (smaller than death-radius D-R), one survive, maintaining overall population.

Attract

Seeds are given attracting force to "grab" particles nearby closer. Accordingly, particles around seeds will be stretched, becoming "branches".

Repell

Bodies are given repelling force to "push" others apart. Repelling is also the key part of expansion - bulging branches and the whole system.

THE PROCESS

The way how thing develops itself is like waving pendulum between thresholds, but they could never reach, it is the neutral and dynamic state that develops the system. It is a non-linear mixture of behaviors and powers, with few behaviors, enormous possibilities evolve. These behaviors, are opposite thresholds. If we cancel any single one from pairs, the system would become imbalanced and single-polarized, and totally lost ability of self-organizing.

By reconstructing BEHAVIOURS
We create SYSTEM

Nature consists of different structure in different scales. Through our human mind, we extract individual rules from phenomenon, in different ways.

© 2019 UVN Lab. Yufan Xie

If we set higher weight to one specific behaviour, the system will show more feature of this prototype.

One of the essential feature of intelligence, is reacting to its environment. By changing variables of environment, the system shows intelligence and responds to surrounding, adapting themselves to field and environment - such as multi-colony growth, obstacle growth and field growth. This means the possibility to utilize variables of complex field and society in practical application.

W e i g h t o f B E H A V I O R S
W e i g h t o f P R O T O T Y P E

TIME as a variable

Accumulative result based on timeline

Cumulated Growth
Filter Rate:20% - 60%
Iteration:600
Search Radius:300
Birth Radius:300

By controlling variables on timeline, we get differentiated form in different stages. (Picture above shows a result of controlling seed amount.)

3D DEVELOPMENT

To improve the performance and application, after months, I started to work on a 3D version, a full-version algorithm with simpler methods for solving extremely complex problems in a 3D level.

Proximity Detection

Average length of sum of vectors within S-R
 $Weight = \text{length}(V1 + V2 + V3 + \dots + Vn)/n$
It provides density and location of pointcloud (inner points are average but outer points are not)

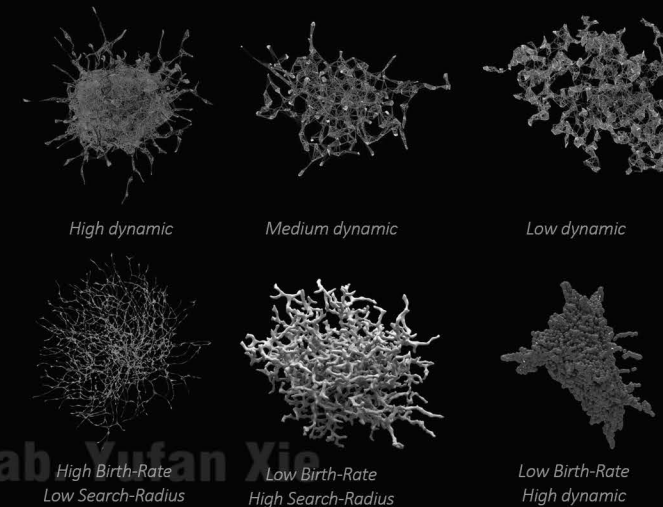

Vector Birth

The average of sum of vectors around within S-R will be applied to seed with a limited random shuffle.
 $Vector = \text{Random} + (V1+V2+V3+\dots+Vn)/n$

SYSTEM
Mathematical density

Behaviors of system can be seen as keys of gene, the properties of system are defined by properties of behaviors.

RE - ENCODING
1 dimensional info
2 dimensional

If we take behaviors from other prototypes like React - Diffusion system, each point of this system can hold more complex information. I assume that, as extracted essential functions, properties of any behavior, can be directly combined with the existing system, just like decoding and re-encoding genes - this is what I plan to experiment next - to develop this system as a Comprehensive Information Model(CIM).

SOCIETY
 $n+$ dimensional info
 $n+$ dimensional behavior

Human society is a multi-dimensional system of basic behaviors, and basic components hold far-more complicated informations - just like chemicals of swarm. For example, the spreading information - internet, breaking news or hot issues - is a layer of complex system similar to React-Diffusion system.

DENSITY
Solid space density
Social life density

Architecture is a explicit form of social hierarchy, it could also be a self-organization - we can find a better solution based on balanced powers - a bottom-up solution. In my schoolwork **BIT-EROSION**, I started my very first experiment on iterative spatial structure.

Bit-Erosion

Fuguoli Community Renewal

Year 4 project
Community Design
International Studio, 2017
Instructor: David Porter, Keren He, John Zhang, Tao Han, Xiaolei Hou, Siyong Liu

This project is a community renovation in section 2 of CAFA Int'l Studio. We collaborate with powers from Tsinghua University and international universities to renovate the declining community.

For me, urban development is an alternation of generations and life habits, in China, this process seems to be more severe - for government planning and booming economy.

Technically, in late 2016, during my pursue of algorithm and computational design, right after my early attempt in form finding, I've been considering hard about algorithm application in other layers of architecture and urban design - it includes spatial topology, social hierachy, and behavior of spaces. Later, in 2017 winter, I put my thinking into practice in this schoolwork, to proof my concept of behavioral social system in complex.

The Dilemma - Broken Context

Hutong

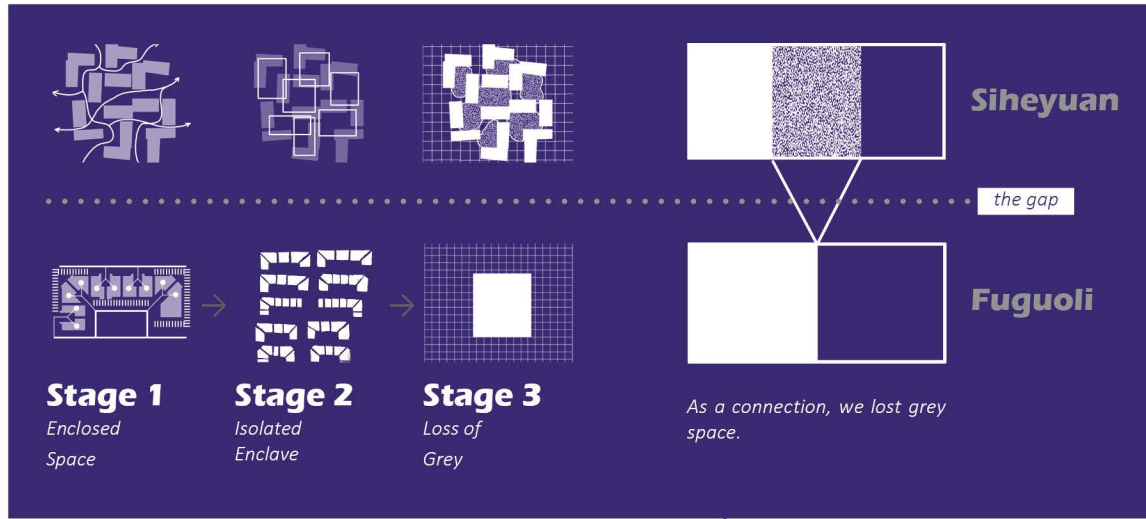

Demolished Space

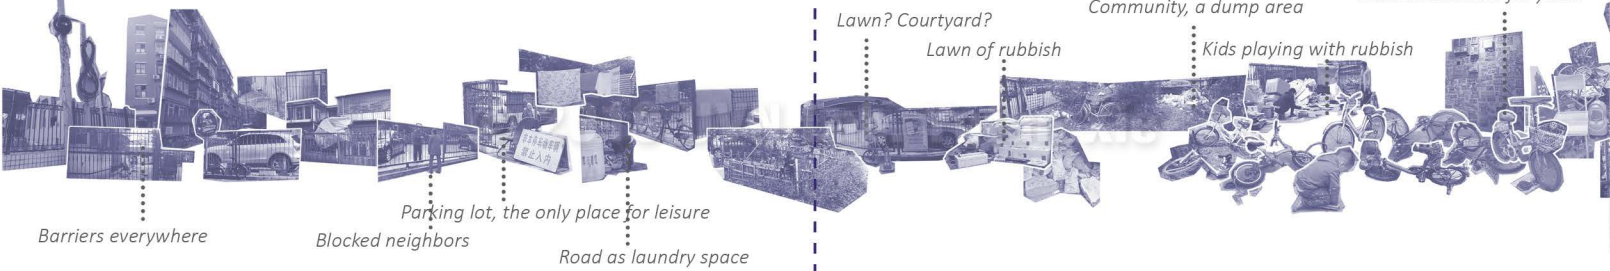

Fuguoli, a typical China community of resettlement located in western downtown area in Beijing, an enclave of abandoned space covering over 20,000 sqm with 16 individual apartments, which used to be an area of demolished Hutong, was chosen to be the site.

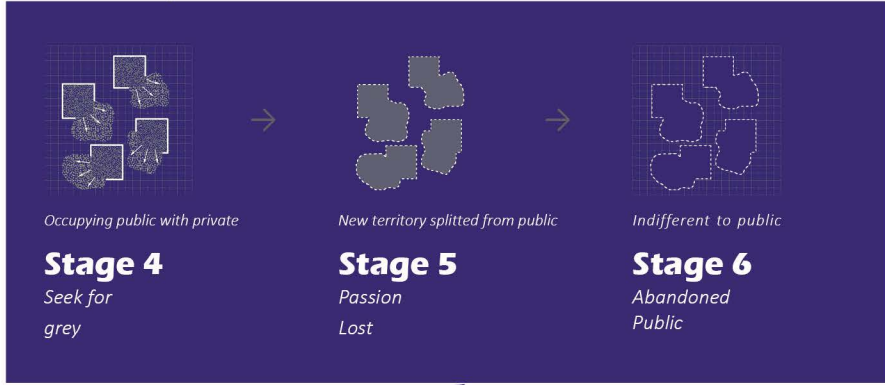

Should **RENEWAL** be planning?
How do we **AVOID**
repeating
the mistake of **DEMOLITION**?
Is there possibility for
ITERATIVE EROSION
rather than
DOGMATIC EXCISION?

Top - Down bringing ORDER?

Bottom - Up causing MESS?

Top-down planning deviated from habit weakened vitality of community

We both lost passion for PUBLIC SPACE

Leaving Residents

Many aged residents wish to move away to suburb, living in high apartments is a trouble for them.

As for middle-aged residents, whose families have children, will stay longer in this community, they are expecting changes to this community.

Alert

*Who are you?
What are you doing to my house?
Don't remove my house anymore!*

Missing

*I do miss my life in Hutongs...
Miss my neighbors...
Those apartments are so tedious.*

Leaving

*I have leg issues...
I'd rather living in suburb...
It's a trouble to go downstairs everyday...
We old peoples hope to leave there...*

Wish

*Our community is so messy.....
Everybody wanna make a change...
But what could we do?
I'd like a courtyard rather than car parks*

Space Left Behind

Framework of Site

Inward Space

Most part of shady rooms (mainly on east and west side of building) are divided into tiny units by aged owners for rent. Frames are kept, walls are changed for space.

Outward Space

Self-built structures of ground floor residents to expand their balcony and basement. It inspired me where the new structure should start from

the Break

Bottom-up Seed

Territory for New Generation

BIT - Workers

There are over 20 million workers from other provinces in Beijing, most of them were born in 80's and 90's.

The power of young workers, might bring more passion and possibilities to this community.

Transportation

*I rent a house in suburb
I spend 4 hours on the road everyday
Totally exhausted.....*

Fees

*Downtown Toon cost over ¥ 5,000 per month
It's still rising.....
That would take a big part of my salary.....*

Environment

*Now I'm living in basement
If possible
I'd like a small cabin on the ground*

A place to stay

*The government is removing old houses
"Low-ends" are forced to move out
Now we got no where to go.....*

Private to Grey

By transforming idle spaces back to shared grey space, the pattern of city changes, OBJECT can be transformed

Keep Framework

Framework, a metaphor of vanished space, revealing the memory of past. By keeping the framework, the context can be preserved.

through

Self-Organized Territory

Accumulative territory above the ground grows from transformed space. Back set form can provide better radiation for each floor.

Dense Units

Low rent, simple, shared public space - space for mixed high-density community. I hope new generations will produce more vitality for this community.

Territory Optimization

Options

Construction

Power-driven Algorithm

The SELF-ORGANIZING SYSTEM is implemented to be the tool for generating space.

On existing structure, the new territory grows. Architecture itself is a hierarchy of power and behavior, the "growth" is a process driven by political and spatial behaviors, will keep growing dynamically, finally reach a balanced space form.

The explicit form is a result of implicit balanced power.

Spatial Behavior

Birth Spare Space

Outer units
low utilization
fulfilling idle spaces

Death Limiting Density

Inner units
removing overcrowded space
maintaining density

Social Behavior

Attracting Power of Capital

Higher density
Higher profit
Higher utilization

Repelling Power of Persons

Lower density
Larger personal space
Better sunshine

Linear Sequence

A repeated pattern is applied to linear space, every 2 private space share a public space chosen from several types.

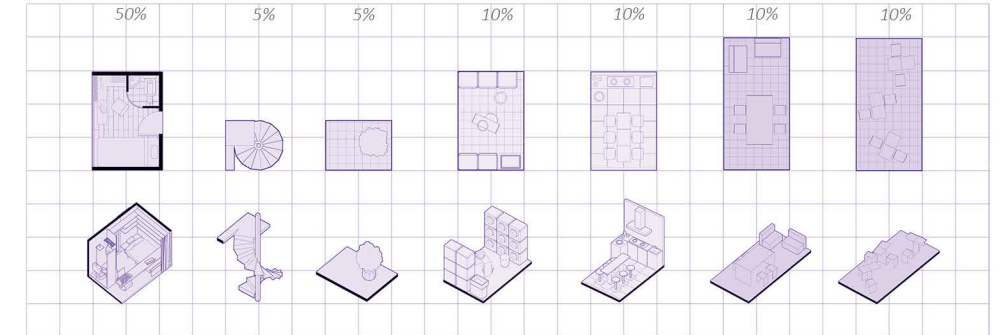

Private Shared

For neighboring shared space, paths will connect them across lines, to increase communication.

Private Unit 1500*2000 50%	Vertical 1500*2000 5%	Balcony 1500*2000 5%	Laundry 3000*2000 10%	Kitchen 3000*2000 10%	Shared Space 4000*2000 10%	Shared Space 4000*2000 10%
----------------------------------	-----------------------------	----------------------------	-----------------------------	-----------------------------	----------------------------------	----------------------------------

*As you watch through the community
old and new
big and small
objects and frames
A huge mixture of society grows
on threshold of spaces*

*On rocks live the corals
they reproduce
aggregate
die
and calcify*

*lives turns to rock
on which new ones rise*

Have we ever return the space we borrowed?

Run! Run! Fuguoli! Run into the sky!

Run through the stratum of city!

Power of capital will automatically drive it as a self-organization.

As generation changes, "new" community turns to be a history, eroded by newer generations. And itself becomes a framework like Fuguoli, supporting our future life.

One day, newer generation would pass, eroded by units with higher density. Our community, our city turns to be hollow shell, the ground would be free, returned to the earth.

Human city would be a illusion. Only from frameworks they left we can see our past, above which our new city could be built. It's a stratum, we left our trace behind, why not return something we borrowed from the earth?

SYSTEM of SPACE

SHARING THE WALL

Great Ormond Social Housing

© 2019 UoW Ltd.

Year 4 project
Social Housing Design
exchange programme
UoW, London, 2018

Instructor: John Zhang

What we are facing is a diversified modern world. Research on individuals and relationship between groups helps us understand the space we inhabit and the model of living. The space is a system - a system of implicit hierarchy, a structure of society.

We were asked to design a social housing in Great Ormond Community without removing any existing building. I implemented a linear sequence of shared wall space, which is similar to my Fuguoli Project, but dealing with totally different context and culture. In a limited space of community, the new housing could be a medium between groups, a system of bridging spaces.

WALL - in a limited community

Limited Space

Snake Wall

Ground for Walking

Lift Up

New Immigrants **Lonely Seniors**

Mid-East immigrant families, mostly with leg issues, who live alone in their flats. Old people with leg issues, who live alone in their flats.

Poor Students **Sick Kids**

Young workers and students in London. Sick Kids and their families/nursing staffs. Additionally for patients from other hospitals nearby.

BRIDGE - between mixed groups

Finding the WALL

Wall space prototype

Units plugged into the wall, extended to face inside

Test 1 - Separate Walls

Test 2 - Curvature Walls

Test 3 - Walls Framing the Space

Seeing through layers

the house is lifted leaving ground open for teenager and passer-by

Single Type

Joined Type

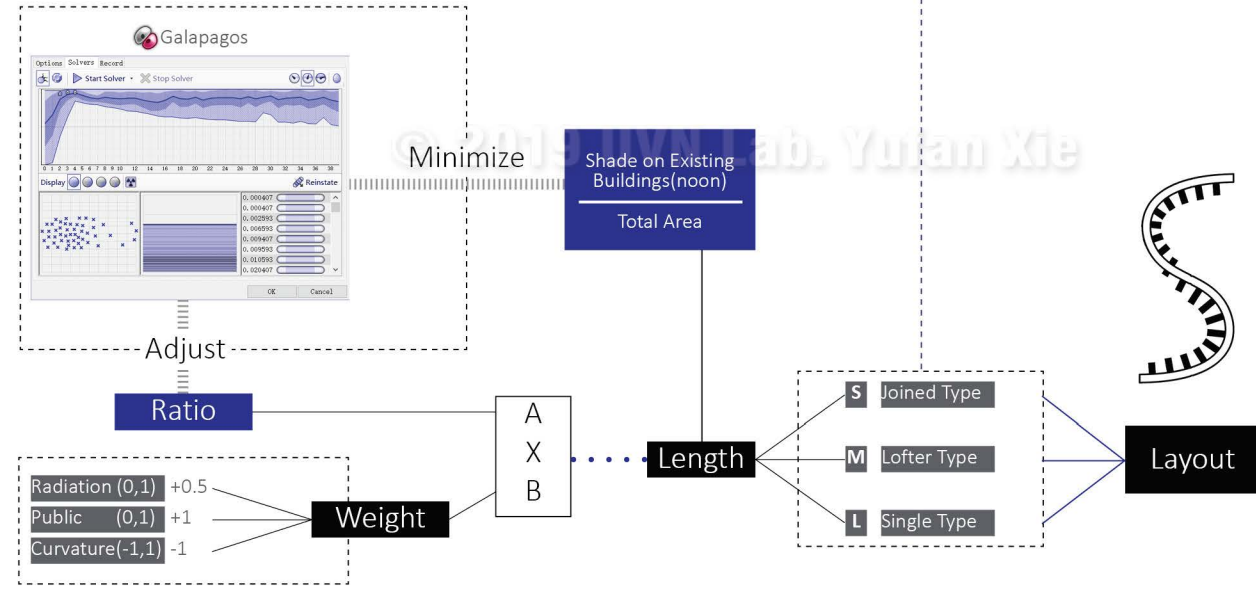

Corner Type

Complex Lofter

Minimize the shade & Maximize the area

I wrote a length-computation method based on an environmental variable, which is a weighted mean of factors of radiation, public and wall curvature. I hope to keep units always facing inside, producing contact between public area and balconies.

Depending on distributed area, several types can be selected from library. Small units are combined to be a larger shared type, middle-sized units are combined vertically to produce higher space quality, large units are designed to be individual single type for higher efficiency.

Finding the BRIDGE

It's not an isolated wall, life within the wall is integrated to the community, by bridges on the roof and lifted arches of the wall. The roofs of lower spaces could be an extended balcony of upper ones, and top roof could be expanded then. A thin wall turned to be a open space in the air.

The ground level is totally free for existing residents, such as childrens and elder ones. Patients from hospitals nearby can play down there, too.

Apartment(linked)

SYSTEM of BODY

004

A DAY OF
WORKAHOLIC

The bell!
A new day!
7.00 a.m.
PRIVATE BODY

Mr.Han
Hegezhuang, Beijing
Sculpture Artist
Writer

PRIVATE
SOCIAL
MACHINE
SOCIAL
PRIVATE

Year 2 project
Villa Design, 2015
Instructor: Lei Mao

The artist Mr.Han, a workaholic who contributed himself to art creations, was chosen to be the owner of this villa. The little house was divided into 3 parts, corresponding to his daily schedule.

Comparing with physical body, the space of our body is a discrete system.

**Private
Box**

**Social
Box**

**Machine
Box**

The body is splitted, into fragments of daily life.

**Houses are boxes
containing our bodies**

Most part of my life is based on works. I hope my livingroom could be a small tube lifted off the ground, with a perfect view in E-W direction. So I can see sunrise and sunset everyday.

**A nice-fried egg! Now let me check my schedule.....
8.00 a.m.**

The kitchen at middle part, together with writing space, is a platform that connects private part and others. He start, and end his day on this level.

The windows on the wall, provided him with a perfect view, to see scenery. Light drips through gaps on the roof, makes the whole space full of cozy atmosphere

SOCIAL BODY

The body interacts and is shaped by social networks.

**Phone call?..... Buyer comes! Be refreshed!
10.00 a.m.**

MACHINE BODY

The body is a machine that produce machines.

The best time of my day! Sculpture is my life!

2.00 p.m. I'd like a big working area in the 1st floor, I'd be happy to see landscape through windows.

INTERIOR LANDSCAPE

The exterior landscape at the center of space, is an interior space of body. It's a private garden for his own, apart from his social life.

I'm stuck! Take a rest. I gotta get a cup of tea...

4.30 p.m. Only in this place can I enjoy my inner peace.

On the middle platform of writing, he ends up his day. Then he could get back to his own life, apart from his daily work. It is close to living room, where he could enjoy his dream.

Ah!! Editor is calling! I forgot my writing work!

11.00 p.m. I wish I could sleep earlier, but my life does not allow to. Luckily this platform is close to livingroom.

Story 1 Folding Space

Track of Space

When we are walking down the streets, we are experiencing the rhythm of aural space. Standing on the crossroad, we are flushed by sea of information and sound.

The street is a linear stage on track, on which we spend out daily.

Story 2 Loop of Boundary

Physical & Abstract boundaries between us

Comparing with linear street, boundaries along the streets - doors, barriers, cars, walls and buildings - are loop sequence of repeating

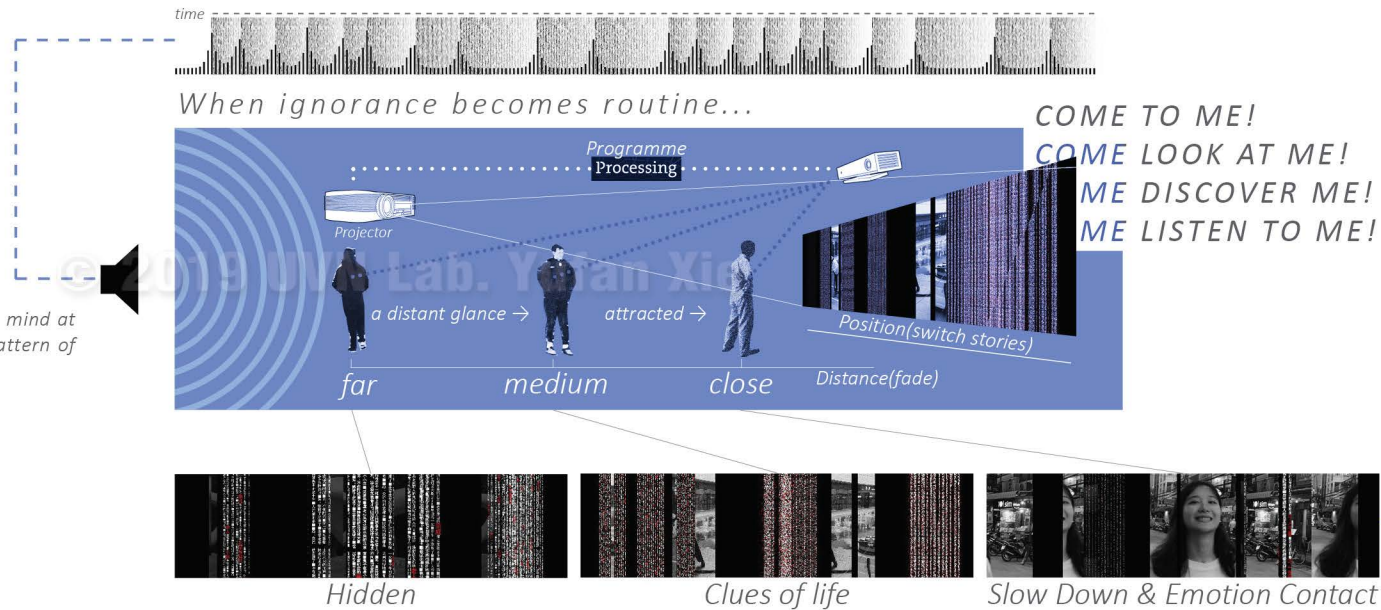

The street, a stage where our story begins

Folding Beijing - Hao Jingfang

The narrative of Folding Beijing is a metaphor of real Beijing nowadays, the nobodies including you and me, are isolated, "FOLDED" into flat characters. By breaking boundary between us, we unfold every single person to a vivid one.

In an unspecified future, Beijing within the 6th Ring Road is divided by three classes physically, sharing the same earth surface in each 48 hour cycle: The first governing class with 5 million population occupy the space for 24 hours from 6 am to 6 am, after which the earth's surface will be turned upside-down, to move the second and third class up. The second class has 25 million middle-class people, and will enjoy 16 hours from 6 am to 10 pm. Then, the building of the second class will fold and retract while the high buildings of the third class unfold and rise, which hosts 50 million lower class people, who can be awake for 8 hours till 6 am. When each class is turned down or folded, the residents there would be put into sleep. Travelling between classes is tightly controlled and violators would be put into jail.

Noise and text of street flushes our mind at intervals, take us along with the pattern of street.

Daily life is flashing fast like barcode, impossible to know a stranger on the street. As we step forward, to see, to touch, boundary fades away, we get directly to stories of single persons.

Boundary loops, until we step forward

Get closer, we discover

Story 3 The Nobody

© 2015 UVA Lab. Yan Xie

I'm a house sale, about 2 years ago I left my home for Beijing.

My daily work is a little bit tedious, some times I have to stand for hours, but I like my co-workers, they are nice guys

I've retired for 30 years, now I'm 90! See? I'm quite fit!

When I was young, China was at war, I still remember the scenes I saw, the enemy was so hateful!

Coincidence! I'm from Sichuan too, I've been working as a cleaner for 4 years.

Tired? Nope, I mean you have to pay for what you wanna get, now I'm working for my whole family!

Me? I'm fixing tiles, my co-workers are upstairs. It's not that hard for me, but you know that, transportation is a trouble for me...I have to spend over 2 hours on my way to downtown everyday.

This cafe is mine, I just begun my business for months. It's not that easy to run this in Beijing, the rent is so high, I'm praying for that everyday.

Cleaners? I don't really care about others around there.....

Corbel structure in Chinese traditional buildings

Corbel Structure in world-wide remnants

History of Corbel Vault

Chinese Traditional dense eaves tower, which was developed from loft-style tower, are masonry buildings with many eaves. Besides, the corbel method is also used in many other traditional buildings.

Today, methods we used to build curvature walls in digital fabrication - deposition printing, bricking with three-axes and 4 axes gantry crane, six-axes robotic - basically are all derivatives of corbel ledge. The difference is only the accuracy of layers.

Normal Vault

Inevitable Horizontal Force
Need support structure

Corbel Vault

Vertical force only
Self-load bearing

Corbel Ledge System is the first application of complex corbel form in real architectural scale. The corbel vault, is a typical brickwork in traditional masonry buildings, where rows of corbels gradually build a wall out from the vertical, has long been used in vaultings, hoods of tower and eaves.

Total Overhang =

$$0.5 * (1 + 1/2 + 1/3 + 1/4 + 1/5 \dots + 1/n)$$

Self Supporting Structure & Algorithm

We designed an LEGO-style algorithm (for the original lego algorithm is not structure-oriented) to generate bricks from non-standard shape. The length, size, location of bricks are specified to enhance the structure (e.g. long bricks are generated mainly in overhang part to afford the load. Lower layers interlace with upper layers to avoid discolation.) Then following the layers, we can easily build complex shape manually without any robot or machine.

Marking Beams

DAY 7

Children voted us with their laughter

Assembling Nodes and Beams

DAY 8

We are divided into 3 groups, to assemble wood frames quickly.

Tensify

DAY 11

Trampoline is a great test of structural stability, beams have to work against stress.

Binding Net

DAY 10

Binding work is quite heavy that we had to work against tension. Luckily, our tutor is professional.

FUTURE

Could **material world** intervene **digital system**?

DEVIATION?

There is a deviation between *rough material world* and smooth *digital systems* - error and accuracy.

FACTOR?

Could we utilize this *deviation* as a *factor*, to make a reverse intervention of material world on digital system in the process of construction?
